

PHASE 2 – UI POLICY CONFIGURATION

1. UI Policy: High Impact Control

1.1 Purpose

The purpose of this UI Policy is to ensure that the **Assignment group** field is mandatory whenever an Incident has a **High Impact** value.

This configuration helps ensure that high-impact Incidents are properly routed to the appropriate assignment group for effective triage and resolution.

2. UI Policy Configuration

configuration	value
name	High Impact control
Table	Incident
Active	True
Condition Field	Impact
Operator	-high

3.UI Policy Action

Field	Mandatory	Reverse if false
Assignment group	True	True

4. Configuration Logic

The UI Policy is configured with the following condition:

Impact is 1 – High

When this condition is satisfied, the UI Policy Action makes the **Assignment group** field mandatory.

When the condition is no longer satisfied, the **Reverse if false** option ensures that the mandatory behavior is automatically reversed.

5. Expected Result

Scenario 1 – High Impact

When:

Impact = 1 – High

Then:

Assignment group = Mandatory

The user must provide an Assignment group before the Incident can be submitted.

Scenario 2 – Impact Condition Becomes False

When the Impact value changes from **1 – High** to another value:

Assignment group = Not Mandatory

The mandatory behavior is automatically reversed because **Reverse if false** is enabled.

6. Test Scenario

Test Case	Condition	Expected Result
TC01	Impact = 1 – High	Assignment group becomes mandatory
TC02	Impact ≠ 1 – High	Assignment group is not mandatory
TC03	Change Impact from High to another value	Mandatory behavior is reversed
TC04	Change Impact back to 1 – High	Assignment group becomes mandatory again

7. Final Outcome

The **High Impact Control** UI Policy ensures that every high-impact Incident has an appropriate **Assignment group** before submission.

This improves Incident routing, supports effective triage, and helps maintain consistent Incident data.
