

PHASE 1 – REQUIREMENT ANALYSIS

Project Title

Implement Client Script & UI Policy (Incident)

1. Problem Statement

Incident records require consistent and accurate data entry for effective triage, routing, and resolution. Manual data entry can result in incomplete, inconsistent, or incorrect information.

This project addresses the problem by implementing **ServiceNow UI Policies and Client Scripts** to control Incident form behavior, enforce field requirements, automatically populate values, and validate data before submission.

2. Objective

The primary objective of this project is to improve data integrity and consistency in Incident records by:

- Making fields mandatory based on specific conditions.
- Automatically setting field values when required.
- Controlling field behavior dynamically.
- Validating data before the Incident record is saved.
- Preventing unauthorized list-based updates.

3. Scope

The project focuses on configuring the **Incident Management** module in ServiceNow using:

- UI Policies
- UI Policy Actions
- Client Scripts
- Form Validation
- JavaScript

These configurations will be used to control and validate Incident form data according to defined business requirements.

4. Functional Requirements

4.1 Mandatory Fields

Certain Incident fields should become mandatory when specific conditions are met.

Example:

- When the Incident state is changed to **Resolved**, the Resolution Information fields should be mandatory.
- When a specific category or condition is selected, the relevant supporting fields should become mandatory.

4.2 Automatic Field Value

The system should automatically populate certain field values based on predefined conditions.

Example:

- Automatically set a default value when a particular category is selected.
- Populate related fields based on the selected Incident information.

4.3 Dynamic Field Behavior

The Incident form should dynamically control field visibility, read-only status, and mandatory status based on user selections.

Example:

- Make a field read-only when a specific condition is satisfied.
- Display or hide fields depending on the selected value.

4.4 Form Validation

Client Scripts should validate Incident data before the record is submitted.

Example:

- Validate that required information has been entered.
- Prevent submission when invalid or incomplete data is provided.
- Display an appropriate error message to the user.

4.5 Prevent Unauthorized List Updates

The system should prevent unauthorized users from modifying restricted Incident information through list-based updates.

Appropriate client-side validation and access controls should be considered to ensure that only authorized users can modify restricted information.

5. Technical Requirements

Requirement	ServiceNow Component
Make fields mandatory	UI Policy / UI Policy Action
Make fields read-only	UI Policy / UI Policy Action
Show or hide fields	UI Policy / UI Policy Action
Automatically set values	Client Script
Validate user input	Client Script
Prevent form submission	Client Script
Control list-based updates	Client Script / ACL as applicable
Dynamic form behavior	UI Policy & Client Script

6. Skills Used

The following ServiceNow and technical skills are required for this project:

- ServiceNow Incident Management
- UI Policy
- UI Policy Actions
- Client Scripts
- Form Validation
- JavaScript
- Incident Form Configuration
- Data Validation

7. Expected Outcome

After implementing the required UI Policies and Client Scripts:

- Incident records will contain more accurate and complete information.
- Required fields will be enforced based on business conditions.
- Users will receive appropriate validation messages.
- Incident form behavior will be dynamic and user-friendly.

- Incorrect or incomplete submissions will be reduced.
- Unauthorized modifications will be restricted.
- Overall Incident data quality and consistency will be improved.

8. Deliverables

The following items are expected to be delivered as part of this phase:

1. Requirement Analysis Document
2. UI Policy configurations
3. UI Policy Actions
4. Client Script configurations
5. JavaScript validation logic
6. Test scenarios and validation results
7. Documentation of implemented configurations

9. Conclusion

The implementation of **UI Policies and Client Scripts** in the ServiceNow Incident module will help ensure consistent data entry, improve validation, and provide better control over Incident form behavior.

This approach will support accurate Incident management and improve the overall quality of Incident records.
